

How does Mobility as a Service (MaaS) work?

With MaaS, urban mobility becomes as simple as planning, booking and travelling, all from a single app.

1 Choose your destination

Open the MaaS (Mobility as a Service) application on your mobile phone and enter the destination you want to go to.

- The app uses GPS to identify your location.
- Put in your preferences: arrival time, maximum travel time, cost or preferred mode of transport (bicycle, public transport, taxi, etc.).

2 Plan your trip

The application analyses the transport options available in real time and proposes several routes combining different modes of transport.

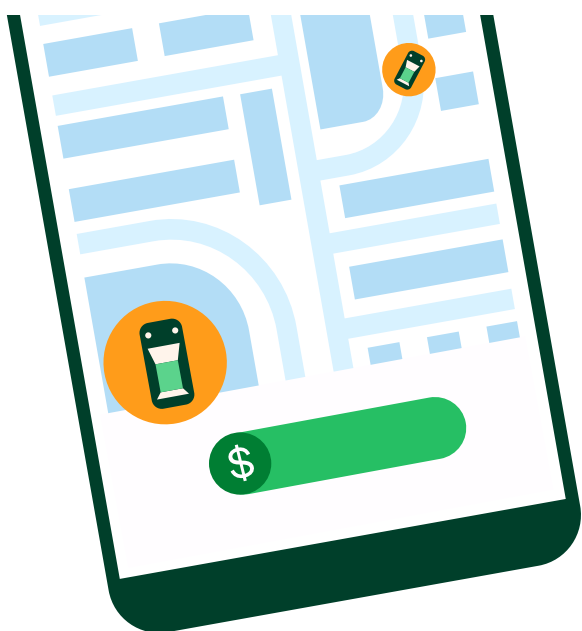

- Optimised routes are shown by time, cost and sustainability.
- The app incorporates real-time information, like delays in public transport or bike availability.

3 Reserve and pay

Once the route has been chosen, the user can book the services from the application itself and pay once for all the legs of the trip.

- Compatible with different payment methods: credit cards, digital wallets (like Apple Pay or Google Pay), or monthly subscriptions.
- Instant confirmation of bookings for each leg.

4 Make your trip

You take your trip as planned and enjoy a seamless experience thanks to the planning of the different modes of transport. During the trip, the app provides real-time updates on your progress.

- GPS-guided navigation.
- Support options in case of mishaps.
