The future of the **Internet of Things** (IoT)

1 **Expansion of connected devices**
It is estimated that by 2025 there will be **more than 75 B IoT devices connected** worldwide.

2 **Connectivity and mobile phones**
5G networks are starting to become more widespread, although so far only 30% of the world's population has access to them. This also opens the door to the next level: **6G networks**

3 **Advances in AI and data analysis**
The combination of IoT with AI will **enable large volumes of data generated** by connected devices to be analysed, optimising processes and improving decision-making in numerous sectors.

4 **Cybersecurity**
The increased number of connected IoT devices will result in a **greater development of and focus on cybersecurity**, with the adoption of zero-trust architectures and advanced measures to protect IoT networks expected.

5 **Driverless cars**
They are already in operation in China, models are still being tested in the United States, and in the near future this **technological innovation** is expected to become a reality in the rest of the world.
